

Frame Relay

Seamless Connectivity For Domestic And International Business

PowerNet Global's frame relay solution is a cost effective data service that will allow your enterprise to connect remote offices in a secure WAN environment. The technology uses permanent, logical connections to pass data between locations.

Benefits

- **Efficient Network Expansion** - Your company can cost effectively utilize frame relay to provide WAN services beyond your on-net locations via UNI or network-to-network interface (NNI) connections.
- **Manage Expenses/Minimize Costs** - In today's capitol-constrained markets, PowerNet Global allows domestic and international frame relay carriers to extend their reach without investing in additional infrastructure or capital.
- **SLAs** - Our frame relay service provides performance, availability and delivery, all backed by SLAs that are among the most aggressive in the industry.
- **Multiple Port/PVC Speeds** - We offer port speeds of DS-0 through DS-3, for terminations both inside and outside the U.S. PVCs are also available in speeds of 56 Kbps to 1.536 Mbps and can be configured either symmetrically or assymmetrically, allowing end users to specify varying bandwidths in each direction.
- **Frame Relay/ATM Service Interworking** - This provides you with a smooth integration of packet-to-cell and/or cell-to-packet data traffic, at no additional cost.

PowerNet Global Communications delivers frame relay services with superior reliability and performance. Our service provides coast-to-coast coverage and extends to countries worldwide, allowing you to offer seamless connectivity for domestic and international business needs.
